QUALITY ASSURANCE | DRAFT FOR REVIEW

Test Plan

KAN-1: Task 1

> **DRAFT - PENDING HUMAN REVIEW. This is not an approved or executable feature test plan.**

Issue	KAN-1 - Task 1
Issue type / status	Task / To Do
Ticket reviewed	26 October 2026
Available requirements	Summary only. Description and acceptance criteria are empty.
Plan status	Blocked pending clarification and QA-owner approval

Key finding: The ticket does not identify a user goal, product behavior, or acceptance criteria. No feature-level pass/fail scenarios can be responsibly derived from "Task 1." The questions below must be answered before this plan can be completed or feature testing can begin.

1. Scope & Objectives

- **In scope:** Requirement-readiness review for KAN-1; identify missing information and the decisions needed to produce a traceable test plan.
- **Out of scope:** Any assumed feature, workflow, UI, API, data change, integration, or product behavior not stated in the ticket.
- **Objective:** Obtain author-approved, observable acceptance criteria and test context. After clarification, map each criterion to positive, negative, boundary, permission, and regression coverage as applicable.

2. Gaps & Questions for the author

Checklist status reflects only the KAN-1 content retrieved on 26 October 2026. "Missing" means the ticket does not specify it; it does not assert that the product lacks the behavior.

ID	Area / checklist status	Finding and question for the author
G-01	Story goal - MISSING	What user or business problem does this task address, and who is the user?
G-02	Acceptance criteria - MISSING	What observable outcomes define success? Please add uniquely numbered, testable acceptance criteria.
G-03	Happy path - MISSING	What is the intended primary workflow, including preconditions, actions, and expected result?
G-04	Negative / error paths - MISSING	Which invalid inputs, failed dependencies, and error states are in scope, and what should users see?

ID	Area / checklist status	Finding and question for the author
G-05	Boundaries and empty states - MISSING	Are there minimum/maximum values, zero/one-item cases, empty/null values, or limits to validate?
G-06	Workflow / state transitions - MISSING	What states and transitions exist, and which transitions are allowed or rejected?
G-07	Data, setup, environment, configuration - MISSING	What data, preconditions, environments, feature flags, or configuration are required? Are there migration or rollback needs?
G-08	Dependencies / integrations - MISSING	Which services, systems, or linked work items does this task depend on? What should happen when a dependency is unavailable?
G-09	Performance - MISSING	Are response-time, throughput, concurrency, or load targets required?
G-10	Security / authorization - MISSING	Which roles may perform or view the behavior? What access must be denied, and are there data-protection constraints?
G-11	Accessibility / localization - MISSING	Which accessibility standard and assistive-technology checks apply? Which locales, languages, or formatting rules are in scope?
G-12	Audit / logging / observability - MISSING	What events, audit records, metrics, or alerts must be produced, and what sensitive data must not be logged?
G-13	Regression / compatibility - MISSING	Which existing features, clients, APIs, data versions, or integrations could be affected? What backward-compatibility expectations apply?
G-14	Devices / responsive / browser matrix - MISSING	Which browsers, devices, screen sizes, or platforms must be supported and tested?
G-15	Designs / attachments - MISSING	Are there approved designs, examples, or other supporting artifacts? None are attached to the issue.
G-16	Terminology / clarity - AMBIGUOUS	“Task 1” does not distinguish the work from other tasks or state its intended outcome. Please replace or supplement it with a descriptive title and scope.
G-17	Planning / ownership context - MISSING	Who owns requirement clarification and QA sign-off? Confirm the intended priority, target release/sprint, and any relevant component; these fields are unset on the issue.

3. Test Scenarios

No product-level functional scenario is currently supportable because the feature and acceptance criteria are unspecified. The following is a readiness gate, not a test of product behavior.

ID	Priority	Type	Scenario / expected outcome	Maps to	Status
TS-0	**P0**	Readiness	Before feature testing, verify the ticket has an author-confirmed goal and scope, measurable acceptance criteria, relevant workflow/error/boundary rules, and named dependencies/environment/data. Pass only when the agreed test basis is recorded and reviewed by QA; otherwise keep execution blocked.	G-01 through G-08, G-17	BLOCKED - information absent

After the author updates KAN-1, create traceable feature scenarios for each acceptance criterion and relevant negative, boundary, role/permission, non-functional, and regression risks. Assign P0/P1/P2 only after impact and likelihood are understood.

4. Test Data & Environment

- **Data:** Not specified; required entities, valid/invalid examples, boundary values, and reset/cleanup needs are unknown.
- **Environment / flags:** Not specified; target environment, build, configuration, and feature-flag state must be confirmed.
- **Roles / permissions:** Not specified; required user roles and access boundaries must be confirmed before testing.
- **Dependencies:** None are identified in the issue; confirm whether external services or linked work are prerequisites.

5. Risks & Assumptions

- **High risk:** Testing against inferred behavior could produce false pass/fail results or miss the intended requirement.
- **Assumption:** "Task 1" is the complete issue summary; no feature requirements were present in its description, links, or attachments at review time.
- **Not assumed:** No domain, user journey, implementation, expected result, priority, or release target has been inferred.
- **Impact:** Functional coverage, risk-based priorities, test data, environment readiness, and regression scope remain undetermined.

6. Entry / Exit criteria

Entry

- Author updates the issue with a clear objective, scope, and testable acceptance criteria.
- Workflow, negative/boundary behavior, applicable roles, dependencies, data, environment, and relevant non-functional expectations are clarified or explicitly marked out of scope.
- QA reviews the updated plan and confirms the test basis before feature execution begins.

Exit

- Once an approved test basis exists: every in-scope acceptance criterion is mapped to an executed result; agreed regression and non-functional checks are complete.
- Release thresholds, required pass rate, and defect-severity tolerance must be agreed after scope and risk are known; they cannot be set from the current ticket.
- Results and unresolved defects are documented, with no unaccepted release-blocking defects.

HUMAN REVIEW GATE

Assumed: Only the issue summary “Task 1” is currently available as a requirement.

Could not confirm: Feature intent, expected behavior, acceptance criteria, priority, target release, dependencies, test data, environment, roles, and non-functional expectations.

Open questions blocking sign-off: G-01 through G-17 above. The author should update KAN-1; QA should then review and revise this draft.

Approval: Approve or edit this draft after the missing requirements are clarified. Do not treat it as final, and do not begin feature test-case or automation work from this draft alone.
